Advanced Materials for the Circular Economy – Fraunhofer LBF at K 2025

How can recyclates be enhanced to reliably perform in demanding, long-lasting applications? From October 8-15, 2025, the Fraunhofer Institute for Structural Durability and System Reliability LBF will answer this question at the K Trade Fair in Düsseldorf. Visit the Fraunhofer booth in Hall 7.0, Stand 70SC05. Visitors will learn how intelligent material strategies can make the circular economy fit for the future and how high-quality plastics can improve the performance and reliability of technical components. The focus here is on smart additive concepts and practical material testing.

In order for plastics, especially recyclates, to be used in highly stressed components, their properties must be optimized and tailored to these technical products. Then, they will work reliably and be efficient and economical to manufacture.

Reliability starts with analysis

Precise material evaluation is the basis for every high-quality recycle application. Fraunhofer LBF analyzes recyclates for degradation, quality differences, and variations between batches. This creates the foundation for targeted material adjustments within the framework of R-strategies. Intelligent additivation compensates for fluctuations and opens up new applications for recyclates, including originally non-durable packaging materials.

Alternative plastics for extreme requirements

Increasing regulations on fluoropolymers challenge companies to qualify new materials for demanding applications, such as electrolyzers. Fraunhofer LBF supports this process by providing comprehensive expertise in selecting and developing suitable alternatives. In its own autoclaves, materials are tested under extreme conditions, such as high temperatures, pressures, and aggressive media, to ensure realism and robustness.

Understand failures. Secure quality.

[Fraunhofer-LBF Troubleshooting](#) offers a structured approach to getting to the bottom of material failures, from damage analysis to optimization. These insights directly

The **Fraunhofer Institute for Structural Durability and System Reliability LBF** in Darmstadt has stood for the safety and reliability of lightweight structures since 1938. With its expertise in the fields of structural durability, system reliability, vibration technology and polymer technology, the institute today offers solutions for three important cross-cutting topics of the future: lightweight system design, functional integration and cyber-physical mechanical engineering systems. The focus is on solutions for social challenges such as resource efficiency and emission reduction as well as future mobility, such as electromobility and autonomous, networked driving. Clients come from sectors such as vehicle construction, aviation, mechanical and plant engineering, energy technology, electrical engineering, medical technology and the chemical industry. They benefit from the proven expertise of around 390 employees and state-of-the-art technology in more than 17,900 square meters of laboratory and testing space. www.lbf.fraunhofer.de
